

BHAVESH ABHAY ACADEMY

BAA M62 • USER OPERATING GUIDE

Learn • Practice • Assess • Review • Progress

- New feature locator added: use the Feature Locator section to immediately see which page/workflow contains each major BAA feature.

Welcome

Welcome to Bhavesh Abhay Academy (BAA).

This guide is for the person who downloads the BAA project and wants to know:

- what BAA is
- which page to open first
- what each part of the system does
- how a Student, Parent or Teacher should use it
- how to use the learning, assessment and AI features
- what the buttons and controls are for
- what currently works locally
- what requires future server/external integration

FEATURE LOCATOR — WHERE IS EVERYTHING?

If you are looking for a particular feature, do not search through the project folder randomly. Use this map first.

Main navigation

Feature / Area	Open this page	What you will find
BAA Home	index.html	Main starting point
Student OS	student-os.html	Main student dashboard, learning, assessments, paths, rewards and student tools
Parent OS	parent-os.html	Parent learning support and conversation tools
Teacher OS	teacher-os.html	Teacher/classroom/institution tools
Teacher Review	teacher-review.html	Human review and evidence-review workflow
Assessments	assessment.html	Assessment workflow
Homework Scanner	homework-scanner.html	Homework/scanning workflow
Knowledge Universe	knowledge-universe.html	Broad learning/exploration
Mathematics World	mathematics-world.html	Mathematics learning
Trust & Privacy	trust-privacy.html	Privacy, trust and data controls

M32-M62 feature locator

Module	Feature	Where the user accesses it
M32	Voice Learning	Student OS

Module	Feature	Where the user accesses it
M33	□ Virtual Labs	Student OS
M34	□ School Portal	Teacher/school workflow
M35	□ Community & Collaboration	Student OS
M36	□ AI Insights Dashboard	Student OS / learning evidence areas
M37	□ Trust & Privacy	Trust & Privacy + relevant OS controls
M38	□ Explainable AI	Student/teacher evidence and review areas
M39	⚙ Review & Appeal	Review/appeal workflow
M40	□ Curriculum & Board Intelligence	Student/teacher curriculum areas
M41	□ Low-Bandwidth Learning	Student OS
M42	□ Assessment Integrity	Assessment + Student OS
M43	□ Scholarship Finder	Student OS
M44	□ Career Preparation	Student OS
M45	□□ Mentor Marketplace	Student OS
M46	□ School ERP	Teacher/institution administration
M47	□ Institution Analytics	Teacher OS
M48	□ Global Collaboration	Student OS
M49	□ Olympiad & Competition	Student OS
M50	□ Plugin Marketplace	Project/integration area
M51	□ Pedagogy	Built into learning behavior
M52	□ Mistake Archeology	Student learning evidence/review
M53	□ Learning Outcomes	Student progress/evidence
M54	□ Cognitive Recovery	Student OS
M55	□ Fresh Start/Data Trust	Trust & Privacy + Student OS
M56	✂ Adaptive Pacing	Student OS
M57	□ Parent Conversation Assistant	Parent OS
M58	□□ Teacher Diagnostic & Differentiation	Teacher OS + Teacher Review
M59	⚙ Human-in-the-Loop Governance	Teacher Review / Trust & Privacy
M60	♥ Purpose Design	Built into the BAA interface
M61	□ Founder Testing Lab	Admin/testing area
M62	□ BAA AI Council	Admin/governance area

□ Easy rule

Student? → Start with **student-os.html**

Parent? → Start with **parent-os.html**

Teacher? → Start with **teacher-os.html**

Human review? → Open **teacher-review.html**

Assessment? → Open **assessment.html**

Privacy/data? → Open **trust-privacy.html**

General starting point? → Open **index.html**

> Some M32–M62 capabilities are system-level modules rather than separate pages. They are intentionally built into the relevant OS instead of creating dozens of confusing menus.

1. □ HOW TO START BAA

Simplest method

After extracting the ZIP file:

- Open the extracted BAA_OS_FINAL_M62_100_PERCENT folder.
- Find **index.html**.
- Open **index.html** in a modern browser.
- The BAA home page will open.
- From the home page, choose the appropriate OS/page.

Main pages

File	Purpose
index.html	Main BAA entry/home page
student-os.html	Student learning OS
parent-os.html	Parent OS
teacher-os.html	Teacher OS
teacher-review.html	Teacher review/assessment area
assessment.html	Assessment system
homework-scanner.html	Homework/scanning workflow
knowledge-universe.html	Knowledge/universe learning area
mathematics-world.html	Mathematics learning area
trust-privacy.html	Trust, privacy and data controls

2. □ RECOMMENDED FIRST USE

For a student, use this order:

Step 1 — Open index.html

This is the starting point.

Step 2 — Open Student OS

Choose the student area and enter the learning environment.

Step 3 — Set up learning information

Use the available profile, goals and learning controls.

Step 4 — Learn

Use the learning resources, practice, revision, learning paths and subject areas.

Step 5 — Take assessments

Use the assessment tools to generate learning evidence.

Step 6 — Review mistakes

Use weakness/revision/intelligence features to understand what needs more work.

Step 7 — Continue the recommended learning path

The system uses available evidence rather than pretending to know something that has not been measured.

3. STUDENT OS

The Student OS is the main learning environment.

Depending on the current build, it provides access to areas such as:

-  Learning resources
-  Assessments
-  Goals
-  AI learning intelligence
-  Learning paths
-  Revision
-  Strengths
-  Weaknesses
-  Rewards
-  Learning evidence
-  Voice learning
-  Virtual labs
-  Low-bandwidth controls
-  Scholarship information tools
-  Career preparation
-  Olympiad preparation

-  Trust and privacy
-  Review and appeal
-  Curriculum tools
-  Pedagogy and learning-safety features

4. ASSESSMENTS

When taking an assessment:

- Open the assessment.
- Read each question carefully.
- Enter your answer.
- Submit when finished.
- The system records the available learning evidence.
- Use the resulting feedback to decide what to study next.

Important

BAA should not be treated as a machine that automatically knows whether a student has mastered something.

It uses evidence.

More useful evidence generally comes from:

- repeated practice
- assessments
- revision
- correct/incorrect responses
- learning history
- comparable measurements over time

5. AI LEARNING INTELLIGENCE

BAA's intelligence features are designed to help answer questions such as:

- What should I study next?
- Which concept needs revision?
- Am I improving?
- What kind of practice should I do?
- Should I revise or move forward?
- What evidence supports this recommendation?

Evidence principle

If the system does not have enough evidence, it should say so.
It should not invent a score or pretend certainty.

6. LEARNING PATHS

Learning paths organize available learning evidence into a sequence.

A typical cycle is:

Learn → Practice → Assess → Review → Revise → Reassess → Progress

If evidence shows that a concept needs revision, the system can direct the student back toward that area.

If evidence supports stronger performance, extension work can be used.

7. HOMEWORK SCANNER

Open:

homework-scanner.html

Use the scanner according to the controls shown on the page.

The important principle is:

The scanner should assist learning, not simply replace learning.

For schoolwork, the student should understand the solution rather than only copying an answer.

8. KNOWLEDGE UNIVERSE

Open:

knowledge-universe.html

This is the broader learning/exploration area.

Use it to explore concepts and subjects beyond one individual assessment.

9. MATHEMATICS WORLD

Open:

mathematics-world.html

Use this area for mathematics-focused learning and practice.

Recommended method:

Understand → Solve → Check → Identify mistake → Retry

10. PARENT OS

Open:

parent-os.html

The Parent OS is intended to help parents understand the student's learning journey.

Parents can use it to:

- review available learning information
- understand progress
- discuss difficult concepts
- support goals
- encourage sustainable study
- use learning-conversation assistance

Parent principle

The system should help the parent support the student, not shame the student.

11. 👤 TEACHER OS

Open:

teacher-os.html

The Teacher OS is intended for classroom/institution workflows.

Relevant areas include:

- student information
- learning evidence
- assessment review
- differentiated learning
- diagnostic grouping
- assignments
- institutional analytics

12. 👤 TEACHER REVIEW

Open:

teacher-review.html

This area is intended for human review of learning/assessment information.

Important:

Human review remains important for consequential decisions.

BAA does not treat an AI-generated recommendation as automatically equivalent to a teacher's professional judgment.

13. □ VOICE LEARNING — M32

Voice functionality depends on the browser/device's speech capabilities.

If voice input or output is unavailable:

- use normal text controls
- try a modern browser
- check whether the device/browser supports speech recognition or speech synthesis

BAA does not claim that every browser supports voice equally.

14. □ VIRTUAL LABS — M33

Virtual Labs provide safe browser-based simulations.

Examples include:

- Projectile Motion
- Ohm's Law
- Quadratic exploration

These are simulations, not physical laboratory equipment.

15. □ SCHOOL MANAGEMENT — M34

The school-management capabilities provide structures for:

- student records
- attendance
- announcements
- school-related learning information

The current prototype should not be confused with a live school ERP unless an actual ERP integration has been configured.

16. □ COMMUNITY — M35

Community features support study collaboration.

Safety is important.

The current implementation includes moderation-oriented checks, but a production public community would additionally require:

- authenticated accounts
- server-side moderation
- reporting

- age/safeguarding controls
- abuse handling
- secure data storage

17. LOW-BANDWIDTH MODE — M41

The low-bandwidth system lets the application use lighter content preferences.

This is useful when internet connectivity is limited.

Important

A low-bandwidth preference is not the same thing as complete offline operation.

True offline synchronization requires additional service-worker/cache/server architecture.

18. ASSESSMENT INTEGRITY — M42

The anti-cheating system uses transparent assessment-integrity signals.

It does not claim:

> "This signal proves the student cheated."

For example, leaving an assessment tab can be treated as a signal requiring review.

It is not proof of misconduct.

19. SCHOLARSHIP FINDER — M43

The scholarship tools can filter/rank scholarship records that are supplied to the system.

Very important

BAA does not invent:

- scholarship names
- deadlines
- amounts
- eligibility
- current availability

When live verified data is not connected, the system should not pretend that it is.

20. CAREER PREPARATION — M44

Career tools can help with:

- skills
- projects

- portfolio preparation
- skill gaps
- career goals

They do not guarantee:

- employment
- internships
- interviews
- recruiter interest
- salary

21. MENTOR MARKETPLACE — M45

Mentor functionality provides a structure for mentor profiles and searching.

A production mentor marketplace would additionally require:

- identity verification
- safeguarding
- payments
- scheduling
- dispute handling
- secure communication

These should be added before real public deployment.

22. SCHOOL ERP — M46

The ERP module provides a vendor-neutral integration contract.

It does not automatically connect to a school's ERP.

To make a real connection, administrators would need to configure:

- provider
- endpoint/API
- authentication
- permissions/scopes
- data mapping
- server-side security

23. INSTITUTION ANALYTICS — M47

Institution analytics summarizes supplied institutional records.

If there is not enough data, the system should show:

Insufficient evidence

rather than inventing statistics.

24. GLOBAL COLLABORATION — M48

Global collaboration provides project/participant structures.

Real-world public collaboration requires:

- accounts
- identity controls
- moderation
- safeguarding
- privacy controls
- server persistence

25. OLYMPIAD & COMPETITIONS — M49

The Olympiad module can create practice plans from supplied topics.

It does not automatically know current competition dates unless current verified competition data is connected.

26. PLUGIN MARKETPLACE — M50

Plugins use a validated manifest structure.

The current implementation does not execute arbitrary plugin code.

This is intentional for security.

A production marketplace would require:

- signed plugins
- sandboxing
- permission controls
- review
- update security
- revocation

27. PEDAGOGY — M51

M51 provides explicit learning-design rules.

Examples include:

- productive struggle
- worked examples after attempts
- spaced review
- evidence-based mastery
- avoiding shame language

These are product design rules, not a replacement for qualified teachers.

28. ❏ MISTAKE ARCHEOLOGY — M52

Mistakes can be grouped by recorded evidence such as:

- concept gap
- calculation
- reading
- procedure
- careless
- unknown

The system should not diagnose the reason for a mistake from one answer alone.

29. ❏ LEARNING OUTCOMES — M53

Outcome measurement works best when comparable observations exist.

For example:

Before: 40 → After: 60

BAA can calculate the change.

Without comparable evidence, it should not claim that learning has improved.

30. ❏ COGNITIVE RECOVERY — M54

This module provides study-safety prompts such as:

- take a recovery break
- reduce task difficulty
- discuss workload with a trusted adult
- maintain a sustainable study pace

Important

This is not medical or psychological diagnosis.

31. DATA TRUST & FRESH START — M55

BAA provides data-control features such as:

- data inventory
- consent controls where supported
- export
- reset/fresh-start controls

Before using a reset function, understand that clearing local data can remove locally stored learning information.

Production cloud/account deletion requires server-side implementation.

32. ADAPTIVE PACING — M56

The pacing system can use supplied information such as:

- available study time
- planned study time
- self-reported energy

It can recommend:

- maintain
- reduce scope
- reduce intensity
- optional extension

It does not secretly infer personal circumstances.

33. PARENT LEARNING CONVERSATION — M57

This provides neutral conversation prompts.

Example approach:

- Ask what felt easy.
- Ask what felt difficult.
- Ask whether the workload feels manageable.
- Agree on one small next step.

The goal is support, not blame.

34. 📁 TEACHER DIAGNOSTIC & DIFFERENTIATION — M58

Teacher evidence can be grouped into:

📁 Reteach

Students needing additional explanation.

📁 Practice

Students who are learning and need more practice.

📁 Extend

Students showing stronger evidence who may benefit from extension work.

This grouping should be treated as instructional assistance, not an irreversible student label.

35. ⚖️ HUMAN-IN-THE-LOOP GOVERNANCE — M59

Consequential AI actions can enter:

Pending Human Review

A human reviewer can then:

- approve
- reject
- request more evidence

This is an important BAA principle:

> AI can assist. Humans remain responsible for consequential decisions.

36. ❤️ PURPOSE & EMOTION DESIGN — M60

BAA's interface design principles include:

- no shame language
- no manipulative urgency
- clear dismissal/exit controls
- visible student choice
- progress as information
- no unsupported emotion inference

37. 🏠 PRIVATE TESTING LAB — M61

M61 provides structures for controlled testing.

It can define:

- cohorts
- experiments
- hypotheses
- metrics

It does not mean that a one-year real-world study has already happened.

38. BAA AI COUNCIL — M62

The AI Council provides a structured record for multiple reviewers.

The system can track:

- topic
- reviewers
- responses
- review completion
- decision readiness

It does not claim that another AI or human expert was consulted unless an actual response has been recorded.

39. TRUST & PRIVACY

Open:

trust-privacy.html

Use this area to understand the current data controls.

Important distinction

A browser/localStorage prototype is not the same as a production secure server.

For public deployment, BAA will need stronger server-side:

- authentication
- authorization
- encryption
- access controls
- audit logging
- deletion controls
- backup/security controls

40. 🗑 IF YOU WANT TO START FRESH

Before resetting data:

- Review what is stored.
- Export anything important.
- Confirm that you really want a reset.
- Perform the reset.
- Start a new learning journey.

Do not reset data just to make a performance history look better.

41. 🚪 IF A PAGE DOES NOT OPEN

Check these first:

A. Did you extract the ZIP?

Do not run the HTML file while it is still inside a compressed ZIP.

B. Is the complete folder present?

BAA pages depend on JavaScript files and other project files.

C. Are you using a modern browser?

Chrome, Edge, Firefox or another modern browser is recommended.

D. Are local browser restrictions affecting a feature?

Some browser features behave differently when an HTML file is opened directly from the filesystem.

E. Is the feature an external integration?

ERP, live scholarship data, mentor services and similar features require their actual service connection.

42. 🛠 FOR DEVELOPERS / ADMINISTRATORS

Important project files include:

- **README.md** — project overview
- **USER-GUIDE.md** — this user operating guide
- **DEPLOYMENT.md** — deployment information
- **SCHEMA.md** — schema information
- **LIMITATIONS.md** — honest limitations/dependencies
- **DEFINITION-OF-DONE.md** — completion criteria
- **CONTINUOUS-M32-M62-STATUS.md** — M32-M62 completion status
- **FINAL-RELEASE-REPORT.md** — final release verification
- **test/** — regression and module tests

43. ☐ TESTING BEFORE MAKING CHANGES

After modifying BAA:

- Run the relevant module test.
- Run the relevant batch tests.
- Run the existing regression suite.
- Check JavaScript syntax.
- Open the affected HTML page.
- Test the user workflow manually.
- Only then treat the change as ready.

44. ☐ CURRENT RELEASE STATUS

BAA M62 RELEASE

62 / 62 modules — 100%

Verification performed in this build:

- ☐ M32-M40 focused verification
- ☐ M41-M50 focused verification
- ☐ M51-M62 focused verification
- ☐ 31/31 M32-M62 individual module tests
- ☐ 45/45 available regression suites
- ☐ 161/161 JavaScript syntax checks
- ☐ Student OS script-reference check

45. ☐ DESIGN CHANGES

The current M62 package keeps the existing OS design as the functional baseline.

The next phase can be:

Design Options → Compare → Advantages/Disadvantages → Our Joint Choice → Apply Design → Regression Test

The design should be changed only after choosing the preferred OS style.

46. ☐ GOLDEN RULES FOR USING BAA

1. Evidence before certainty

If BAA does not have enough evidence, it should say so.

2. AI assists; humans decide

Especially for important student/institution decisions.

3. Never invent live information

External data must come from an actual connected/verified source.

4. Protect student dignity

No shame-based learning.

5. Student agency matters

The student should understand and participate in the learning process.

6. Safety comes before features

A feature should not be made "complete" by pretending unsupported security or infrastructure exists.

QUICK START CARD

New user?

- Open **index.html**
- Choose your OS
- Set up your learning/profile information
- Learn
- Practice
- Assess
- Review mistakes
- Follow the learning path
- Reassess
- Track progress
- Use Parent/Teacher OS when support or review is needed

Version

BAA M62 — 100% Module Release

This guide describes the current software baseline and its honest operating boundaries.
